Understanding the LM35 Temperature Sensor
What is the LM35? The LM35 is a precision integrated-circuit temperature sensor developed by National Semiconductor. It provides an output voltage linearly proportional to the Celsius temperature, making it straightforward to read and interpret. Unlike thermistors, the LM35 offers a higher accuracy and a wider temperature range, making it suitable for various control applications.

Key Features of LM35
Linearly proportional voltage output (10mV/°C)

|
|---- Vout (to microcontroller or comparator circuit)
|
GND of LM35 ---- [Ground]
  
```

Additional components: LM35 output connected to an ADC pin of the microcontroller. Microcontroller configured with a threshold value. Buzzer connected to a digital output pin via a transistor or driver circuit.

Step-by-Step Construction Guide

Step 1: Setting Up the Temperature Sensor

Connect the LM35's Vcc pin to the +5V power supply. Connect the GND pin to ground. Connect the Vout pin to an analog input pin of your microcontroller or a comparator input.

Design for proper grounding to reduce noise. Follow datasheet recommendations for maximum ratings and pin configurations. Prototyping and PCB Design For initial testing, breadboards are convenient. For production or permanent setups, design a custom PCB using tools like Eagle or KiCad. Ensure clear labeling and organized routing for reliability. Firmware Development Programming the PIC microcontroller involves writing code that controls hardware operation. Development Environment IDE Options: MPLAB X IDE (from Microchip), MPLAB Code Configurator (MCC), or third-party IDEs. Programming Languages: Mainly C, with assembly language for low-level control. Writing the Firmware Key steps include: Initialization Configure oscillator settings. Set I/O pin directions. Initialize peripherals (ADC, UART, timers). Main Logic Implement core functionality (e.g., reading sensors, processing data). Use interrupts for real-time tasks. Manage communication protocols. Testing and Debugging Use simulators and debugging tools. Verify each module before integrating. Example: Blink an LED

```

#include <pic.h>
#define _XTAL_FREQ 8000000 // 8MHz oscillator
void main()
{
    TRISBbits.TRISB0 = 0; // Set RB0 as output
    while (1) {
        LATBbits.LATB0 = 1; // Turn LED on
        __delay_ms(500);
        LATBbits.LATB0 = 0; // Turn LED off
        __delay_ms(500);
    }
}
