 Fundamental Java Concepts in MSBTE Notes
 Introduction to Java
 Java, developed by Sun Microsystems in 1995, is a high-level, object-oriented programming language. Its key features include platform independence (write once, run anywhere), automatic memory management (garbage collection), and robustness.

Features of Java:
 Simple and familiar syntax derived from C/C++
 Portable: bytecode runs on any JVM
 Secure: built-in security features
 Multithreaded: supports concurrent processing
 Dynamic: supports dynamic memory allocation

Data Types and Variables
 Java provides various data types to handle different kinds of data:
 Primitive types: byte, short, int, long, float, double, char, boolean
 Reference types: objects, arrays, classes

Variable declaration example:

```
int age = 20;
char grade = 'A';
boolean isPassed = true;
```

Operators and Expressions
 Java operators include arithmetic (+, -, *, /), relational (==, !=, >, <), logical (&&, ||), and assignment (=).
Example:

```
int sum = a + b;
if (a > b && b != 0) { // Code block }
```

Control Statements and Looping Constructs
 Control structures control the flow of execution.
 Conditional Statements: if-else, switch-case
Example:

```
if (marks >= 40) {
    System.out.println("Pass");
} else {
    System.out.println("Fail");
}
```

Looping Statements
 for loop, while loop, do-while loop
Sample for loop:

```
for (int i = 0; i < 10; i++) {
    System.out.println(i);
}
```

Arrays and Strings
 Arrays store multiple data elements of the same type.
Example:

```
int[] numbers = {1, 2, 3, 4, 5};
```

Strings
 Strings are objects in Java, used to handle text.
Example:

```
String name = "MSBTE";
System.out.println(name.length());
```

Object-Oriented Programming (OOP) in Java
 OOP is at the core of Java programming, and understanding its principles is vital for MSBTE students.

Classes and Objects
 Class: blueprint for objects
 Object: instance of a class
Example:

```
class Student {
    String name;
    int rollNumber;
    void displayDetails() {
        System.out.println("Name: " + name);
        System.out.println("Roll Number: " + rollNumber);
    }
}

public class Main {
    public static void main(String[] args) {
        Student s1 = new Student();
        s1.name = "Rahul";
        s1.rollNumber = 101;
        s1.displayDetails();
    }
}
```

Inheritance
 Inheritance allows a class to acquire properties from another class.

```
class Animal {
    void eat() {
        System.out.println("This animal eats food");
    }
}

class Dog extends Animal {
    void bark() {
        System.out.println("Dog barks");
    }
}
```

Polymorphism
 Ability of an object to take many forms, typically through method overriding and overloading.

Encapsulation and Abstraction
 Encapsulation: wrapping data with methods
 Abstraction: hiding complex details

Exception Handling in Java
 To write robust programs, understanding exceptions is important.
 Try-Catch
Example:

```
try {
    int result = 10 / 0;
} catch (ArithmeticException e) {
    System.out.println("Cannot divide by zero");
}
```

File Handling
 Java provides classes for file operations.
 Reading a file:

```
import java.io.File;
import java.io.FileReader;
import java.io.BufferedReader;

public class ReadFile {
    public static void main(String[] args) throws Exception {
        File file = new File("example.txt");
        BufferedReader br = new BufferedReader(new FileReader(file));
        String line;
        while ((line = br.readLine()) != null) {
            System.out.println(line);
        }
        br.close();
    }
}
```

Multithreading Basics
 Multithreading allows concurrent execution of threads.
 Simple Thread Example:

```
class MyThread extends Thread {
    public void run() {
        System.out.println("Thread is running");
    }
}

public class Main {
    public static void main(String[] args) {
        MyThread t1 = new MyThread();
        t1.start();
    }
}
```
