Common Problems and Their Step-by-Step Easy Solutions

Problem 1: Four-Bar Linkage Velocity Analysis Scenario: Given the input link rotates at a known angular velocity, find the velocity of the output link. Solution outline: Draw the four-bar linkage clearly. Assign known values: input angular velocity (ω_{input}), link lengths. Write the vector loop equation: $\vec{r}_1 + \vec{r}_2 e^{i\theta_2} = \vec{r}_3 + \vec{r}_4 e^{i\theta_4}$ Differentiate with respect to time to find the velocity relation. Solve for the unknown velocity using known input velocity and geometry. Cross-verify with graphical methods if needed.

Problem 2: Instantaneous Center of Velocity (IC) Method Scenario: Find the velocity of a point on a link using the IC method. Solution steps: Identify the link and points of interest. Draw the mechanism in the current position. Locate the instantaneous centers by intersecting perpendiculars of velocity directions. Use the relation: $v = \omega \times r$ where (r) is the distance from the IC to the point. Calculate the velocity magnitude and direction.

Problem 3: Cam Profile Design Scenario: Design a cam profile for a specified displacement, velocity, and acceleration. Solution approach: Draw the displacement

diagram over the cam rotation. Divide the motion into segments: rise, dwell, return, etc. Derive the equations for displacement, velocity, and acceleration in each segment. Plot the cam profile based on these equations. Ensure the profile meets the constraints for smooth operation.
