QuestionAnswer

What are the primary adaptations of the cardiovascular system during aerobic exercise training?

The primary adaptations include increased stroke volume, cardiac output, capillary density in muscles, and improved blood flow efficiency, leading to enhanced endurance and reduced heart rate at submaximal workloads.

How does muscle fiber type influence performance and training strategies?

Muscle fiber types (Type I and Type II) determine endurance and power capabilities; Type I fibers are suited for endurance activities, while Type II fibers excel in short, high-intensity efforts. Training can influence fiber recruitment and hypertrophy based on these characteristics.
